ASCE PIPELINES 2014 CONFERENCE

Portland, OR | August 3-6

From Underground to the Forefront of Innovation and Sustainability

Design of Utility Pipelines Through an Active, Urban Landslide

Carol Ruiz, Project Manager Gibbs & Olson

David Higgins, Lead Geologist Shannon & Wilson

Why Project Needed?

Project Area

Project Area

 30 blocks of urban residential area within large active landslide

Existing Conditions - Piping

- terracotta w/ areas of corrugated metal and PVC
- Brittle gray cast iron

Unique Challenges

- Pipelines through two large, active landslides
- Creeping ground movements, variable rates and direction
- Extreme slopes up to 28 percent
- Shallow groundwater and groundwater springs

ASCE | Pipelines 2014 Conference Portland, OR | August 3-6, 2014

History and Background

- Residential hillside on top of ancient landslide complex
- Activity varies
- Surface and subsurface indicators of differential movement
- Occasional catastrophic failures

1st Phase – Geotechnical Mapping

- Performed preliminary geologic hazard evaluation
- Reviewed existing, documents, sewer video and other data
- Field visits to document existing conditions

ASCE | Pipelines 2014 Conference Portland, OR | August 3-6, 2014

1st Phase – Geotechnical Mapping

- Plotted GIS base maps
- Identified areas of tension, compression, and translation
- Determined dominant direction
- Assigned classification and rating system
- Developed boring plan

ASCE | Pipelines 2014 Conference Portland, OR | August 3-6, 2014

2nd Phase – Geotechnical Explorations

Photo 1: B-1, Box 1, Run 1 at 32.5' to Run 3 part at 43.1'

Photo 2: B-1, Box 1, Run 3 continued at 43.1' to Run 5 part at 52.4'

- 14 bore locations
- 5 observation wells
- 2 vibrating piezometers
- 2 inclinometer casing
- Other field and laboratory testing
- Follow up instrumentation monitoring

Slope Inclinometers

- 2.75 inch slope inclinometer casing installed to depth of 60 feet in two borings
- After initial reading , subsequent readings made to determine direction and magnitude of movement
- Recorded 2.5 inches of cumulative surface movement in a period of 23 months

ASCE | Pipelines 2014 Conference Portland, OR | August 3-6, 2014

Pipeline Design

- Accommodate vertical & longitudinal movement
- Groundwater collection
- Vaulted/hallow sidewalk
- Steep slopes
- Joint trench for sewer/storm
- Major vault on cross street

ASCE | Pipelines 2014 Conference Portland, OR | August 3-6, 2014

Pipeline Design

Collection & Redirection of Groundwater

- Two methods
 - Trench cutoff walls with slotted under drains
 - Interceptor drains in key locations using drywell structures

ASCE | Pipelines 2014 Conference Portland, OR | August 3-6, 2014

Trench Dam

TRENCH DAM AND INTERCEPTOR DRAIN DETAIL
